

CSA5112 - Cryptography and Network Security

6. Rail Fence Cipher

Aim: To implement the Rail Fence Cipher using two rails.

Algorithm:

1. Start.
2. Read plaintext.
3. Write characters in zig-zag form.
4. Read row by row.
5. Display ciphertext.
6. Stop.

Code:

```
#include<stdio.h>
```

```
#include<string.h>
```

```
int main()
```

```
{
```

```
    char text[100];
```

```
    int i;
```

```
    printf("Enter Text: ");
```

```
    scanf("%s",text);
```

```
    printf("Cipher Text: ");
```

```
    for(i=0;text[i]!='\0';i+=2)
```

```
        printf("%c",text[i]);
```

```
    for(i=1;text[i]!='\0';i+=2)
```

```
        printf("%c",text[i]);  
  
    return 0;  
  
}
```

Sample Input:

```
Enter Text: HELLOWORLD
```

Sample Output:

```
Cipher Text: HLOOLELWRD
```

Result:

The Rail Fence Cipher algorithm was successfully implemented, and the plaintext was encrypted using the rail fence transposition method.
